

Developing an Algorithm for Dividing Fractions

To help me develop an algorithm for dividing fractions, I'll explore what happens when I divide a whole number by a fraction.

$$6 \div \frac{1}{2}$$

- How would I explain the problem using the words *dividend*, *divisor* and *quotient*?

$$6 \div \frac{1}{2}$$

I'll use a diagram to illustrate what happens when I divide six by the fraction *one-half*.

- How would I explain the six circles shown in the diagram?

$$6 \div \frac{1}{2}$$

- How would I use the circles to illustrate dividing by the fraction *one-half*?

$$6 \div \frac{1}{2}$$

- How do the circles illustrate the solution to my problem?

 $6 \div \frac{1}{2}$

- How could I also describe my solution using multiplication?

 $6 \div \frac{1}{2} = 12$

Compare the two calculations shown below.

$$6 \div \frac{1}{2} = 12 \quad 6 \times \frac{1}{2} = 12$$

- How is it possible that both calculations solve the same problem?
- How would I explain and demonstrate writing the reciprocal of a fraction?

Handwritten math: $2ab + 6k$

I'll use the diagram shown below to write a new division problem.

- How would I explain this part of the diagram using my division problem?

- How would I explain this part of the diagram using my division problem?

- How does the last line of the diagram illustrate the solution to my division problem?

- How would I use multiplication to calculate the same solution to my division problem?

$$\boxed{6} \div \boxed{\frac{2}{3}} = \boxed{9}$$

- How would I explain and demonstrate using *multiply by the reciprocal* to solve the problem?

$$6 \div \frac{2}{3}$$

- How will I explain my thinking as I perform the calculations required to solve?

$$6 \times \frac{3}{2}$$

I'll try *multiplying by the reciprocal* to solve a new problem... *dividing a fraction by a fraction*.

- How would I explain rewriting the division problem in preparation for *multiplying by the reciprocal*?

$$\frac{2}{3} \div \frac{3}{4}$$

- How will I explain and demonstrate my calculation... *multiply by the reciprocal*?

$$\frac{2}{3} \times \frac{4}{3}$$

- How do I determine if my solution is shown in *lowest terms* or if it can be *simplified*?

$$\frac{2}{3} \times \frac{4}{3} = \frac{8}{9}$$

Developing an Algorithm for Dividing Fractions

Which statements do I feel confident explaining and demonstrating?

Which statements do I not feel confident explaining and demonstrating?

- ✓ I can explain a division problem using the words dividend, divisor and quotient
- ✓ I can draw a diagram to illustrate dividing a whole number by a fraction
- ✓ I can explain how multiplication can also solve dividing a whole number by a fraction
- ✓ I can explain how I write the reciprocal of a fraction
- ✓ I can explain and demonstrate how I use the reciprocal of a fraction to solve division problems
- ✓ I can explain and demonstrate how I simplify or reduce a fraction to lowest terms

$$\frac{2ab + 6k}{2ab + 6k}$$
